(54) SYSTEM, APPARATUS AND METHOD FOR WIRELESS MOBILE COMMUNICATIONS IN ASSOCIATION WITH MOBILE AD-HOC NETWORK SUPPORT

(57)

The present invention generally relates to a mobile communication technology combining with AD-HOC, and more specifically, to a mobile communication system configured to include a fixed communication facility for controlling communication between mobile terminal devices such as a transmission mobile terminal device, a reception mobile terminal device and other non-participation mobile terminal devices, and for mediating communication between the transmission mobile terminal device and the reception mobile terminal device. An AD-HOC network is formed between the mobile terminal devices, each device including a second frequency communication means for direct communication. When the AD-HOC network is formed between the transmission mobile terminal device, the reception mobile terminal device and other non-participation mobile terminal devices via the second frequency communication means, the transmission mobile terminal device can communicate with the reception mobile node via the AD-HOC network. Accordingly, the disclosed wireless mobile communication system can be effectively operated with reduced communication cost.
